Comment 1: Research Gap and Novelty

The research gap should be further strengthened by providing a more critical review of recent studies. Clearly explain how the proposed research differs from existing studies and identify the specific novel contribution of the study.

Comment 2: Research Methodology and Sampling Design

The research methodology requires further clarification regarding the sampling plan, sample size justification, selection of pharmaceutical-water samples, and criteria for isolate identification. The proposed methods should be specified sufficiently to ensure scientific validity and reproducibility.

Comment 3: Statistical Analysis and Hypothesis Testing

The statistical analysis section should be aligned more closely with the research objectives and hypotheses. Clearly specify the proposed statistical tests, dependent and independent variables, treatment of isolate-level variation, and model validation criteria.

Comment 4: References and Academic Presentation

The references and in-text citations should be carefully verified for accuracy, relevance, and consistency with the prescribed referencing style. The title page, declaration, table of contents, and overall formatting should also be revised according to university guidelines. The discipline mentioned on the title page should be finalized before submission.
