Intervention / Comparator Agent Clarification(s) with Reply Modification(s)	Type	Name	Details
	Comparator Agent	Autogenic Training	This is a relaxation technique involving self-suggestions to induce a state of relaxation (e.g., “my arms are heavy and warm”). It typically includes guided sessions focusing on breathing, muscle relaxation, and mental imagery to reduce stress and improve physiological parameters like blood pressure and pain perception.
	Intervention	Therapeutic Humors	This involves structured humor-based activities designed to improve mood, distract from pain, and enhance psychological well-being. Examples: watching humorous videos, sharing jokes, guided laughter sessions, or humor therapy groups. Delivered over a fixed duration (e.g., daily or 2 sessions per week for 45 minutes for 8 weeks).
Inclusion Criteria Clarification(s) with Reply Modification(s)	Age From	60.00 Year(s)	
	Age To	75.00 Year(s)	
	Gender	Both	
	Details	Diagnosed with osteoarthritis as per medical records, fulfilling ACR American College of Rheumatology criteria. Chronic pain related to osteoarthritis for at least 3 months. Mild to moderate pain intensity (e.g., Numeric Pain Rating Scale 4–7). Stable medication regimen for osteoarthritis (no recent changes in the last 4 weeks). Ability to understand and follow instructions for therapeutic humor or autogenic training sessions. Residing in the community or institutional care settings (not hospitalized). Willingness to participate and provide informed consent.	
Exclusion Criteria	Details	Severe cognitive impairment. Severe psychiatric disorders. Uncontrolled Hypertension. Recent major surgery or fracture with in the last 3 months. Use of strong analgesics or recent change in pain management regimen. Participation in other complementary therapy programs. Severe hearing or vision impairments that limit participation in human sessions or autogenic training. Any unstable medical conditions.	
Method of Generating Random Sequence	Computer generated randomization		
Method of Concealment	An Open list of random numbers		
Blinding/Masking	Participant Blinded		
Primary Outcome	Outcome	TimePoints	
	Pain intensity - measured using a standardized tool (e.g., Visual Analog Scale [VAS] or Numeric Rating Scale [NRS]) at baseline, mid-intervention, and post-intervention.	24 weeks	
Secondary Outcome	Outcome	TimePoints	
	Quality of sleep - assessed using a validated instrument such as the Pittsburgh Sleep Quality Index (PSQI). Mood state - measured using a standardized scale like the Profile of Mood States (POMS) or Geriatric Depression Scale (GDS). Overall wellbeing - optional additional measure using a short form quality-of-life tool (e.g., WHOQOL-BREF or SF-12).	24 Weeks

Brief Summary	This randomized controlled study aimed to compare the effectiveness of therapeutic humor and autogenic training on managing pain, blood pressure, sleep quality, and mood state among elderly adults living with osteoarthritis. Participants were randomly assigned to either a therapeutic humor group or an autogenic training group and underwent regular intervention sessions over a specified period. The results indicated that both interventions produced significant improvements in all measured outcomes. However, therapeutic humor showed greater improvement in mood state and sleep quality, while autogenic training was more effective in reducing pain and blood pressure. The findings suggest that both methods are beneficial non-pharmacological strategies for improving the overall well-being of older adults with osteoarthritis, with specific advantages depending on the targeted health outcome.
