

Reliability Test Results of Responses of Small Traditional Retailers:

A Cronbach's Alpha value of 0.775 indicates acceptable reliability for your 48-item scale based on 77 observations. This means that the items in your scale are reasonably consistent in measuring the same construct. However, on deleting an individual item number 11 (@13-2nd), the reliability can increase up-to 78.6 reaching its maximum reliability.

Reliability Test for Customer Responses:

A Cronbach's Alpha value of 0.864 indicates good reliability for your scale. This indicates that the 22 items in your dataset are highly consistent in measuring the same construct. However, considering a sample size 19 observations is relatively small for reliability analysis and a minimum number of 30 observations (respondents) is preferred. Further, on deleting an individual item number 16 (@11), the reliability can increase up-to 86.9 reaching its maximum reliability.
