ABSTRACT

In modern times, it has become essential for organizations to brace themselves for unexpected events as the effects of these occurrences on organizations and the stress they generate are evident. Events like the September 11 attacks in 2001 and the worldwide spread of the Covid-19 pandemic remind organizations that unimaginable situations can and do occur. Resilience and effective leadership could potentially mitigate the stress and uncertainty and lead towards corporate entrepreneurship. To ensure objectivity in the research, as advised by specialists, this study employs a positivist research paradigm. In the context of a positivist approach, probability sampling is a commonly employed technique. This article utilizes stratified sampling. Respondents with at least five years of experience were selected for this study and the collection of information was done by means of a close-ended questionnaire. The sample size of 377 respondents was computed using Rao-soft software. In addition, Smart PLS-3 software was used for SEM to test both the measurement models and the structural equation modeling**.** This study contributes towards understanding the relationship between resilient leadership and corporate entrepreneurship. The existing research on resilience underscores its enduring significance, as its fundamental idea is to maintain an organization's unity and integrity amidst the challenges and disruptions brought on by adversity. The implications of this research are applicable to leaders at various levels including managers and organizational leaders where innovation has a significant role.

INTRODUCTION

In modern times, it has become essential for organizations to brace themselves for unexpected events, as the effects of these occurrences on organizations and the stress they generate are evident. The attack of September 11 in the year 2001 and the pandemic of Covid-19 across the globe remind organizations that situations unimaginable can indeed occur. The unfortunate crisis of Covid-19 starting from December 2019, had a deep impact on humanity and organizations as well. The global pandemic was a health emergency that not only hastened the evolution of work dynamics but also significantly jeopardized employees' interpersonal connections. The Covid-19 pandemic caused significant stress for individual workers, leading to major changes in their daily lives and job security (Hu, He, and Zhou, 2020), along with heightened feelings of uncertainty and

anxiety. Encounters with death (such as during the Covid pandemic) triggered anxiety and withdrawal responses, which diminished levels of engagement (see also Sliter, Sinclair, Yuan & Mohr, 2014). This, in turn, led to physical and emotional strain on employees, resulting in diminished mental health and wellbeing. It was proposed that resilience and effective leadership could potentially mitigate the stress and uncertainty. Due to the shift towards remote work across multiple industries, an estimated 25 million individuals have been projected to lose their jobs (International Labor Organization, 2020). Craven (2020) anticipates that the current circumstances could lead to a recession, with worldwide growth declining between 0.5% and 1.5%.

It has been repeatedly demonstrated throughout history that organizations shall possess the ability to evolve, modify and innovate to fulfill the demands of an ever-evolving market. To effectively adapt, businesses must improve their capacity for innovation and leverage the creative potential associated with their workforce (Lee and Pati, 2017). The importance of corporate entrepreneurship is evident, particularly considering the frequent challenges that companies encounter in contemporary times. In the field of business management, having advanced problem-solving abilities, analytical thinking, and creativity are crucial skills for workers (Kruchoski, 2016). However, due to shifts in the business landscape, fostering an entrepreneurial mindset within organizations is regarded as a key factor in promoting innovation through the pursuit of new business opportunities and maintaining growth. The contemporary world is undergoing a transformation due to significant global shifts (Chychun et al., 2023). Leaders within organizations face considerable challenges presented by current global phenomena such as globalization, digitization, the Covid'19 pandemic, and increasing international competition. They are consistently confronted with the need to adapt to change while also being required to react swiftly to unexpected events (Dalati, 2017). The ability of an organization to demonstrate resilience is a vital component for successfully managing crises (Barasa et al., 2018). The existing research on resilience underscores its enduring significance, as its fundamental idea is to maintain an organization's unity and integrity amidst the challenges (Gölgeci et al., 2020). Attributes such as efficacy, empowerment, a clear vision, the ability to support and respond are proposed as essential for developing resilient leaders. In a related investigation, Hasel (2013) suggests that crises can negatively impact leadership effectiveness, leading to a decline.

Research indicates that individuals with high resilience tend to handle challenges and changes more effectively (Rossi, Meurs, & Perrewé, 2013). However, studies surrounding this topic are still emerging, with a majority concentrating on how various leadership styles relate to employee resilience (Sommer et al., 2016) instead of exploring the impact that resilient leadership has on corporate entrepreneurship.

This research aims to explore how resilient leadership can affect corporate entrepreneurship and how employee engagement serves as a mediator in this relationship. Additionally, it highlights the role of organizational culture as a moderator of employee engagement and corporate entrepreneurship. By examining these factors, the study intends to offer valuable insights into refining leadership strategies to effectively manage crises and enhance corporate entrepreneurship.

Theoretical Lens

According to the principal-agent theory, resilient leadership significantly influences the innovation efforts and overall performance of an enterprise. The actions of managers are heavily influenced by the alignment of interests between them and the shareholders. When these interests align, managers are more likely to focus on long-term strategic development goals, with innovation and enterprise performance at the forefront; conversely, when these interests are not aligned, managers often prioritize short-term financial results. Consequently, providing equity to executives and shifting some operational risks to management can align the interests of executives with the performance of the company, mitigating their tendency for short-term self-serving behavior and allowing them to concentrate on innovative pursuits that carry certain risks but are advantageous for the long-term growth of the organization, ultimately leading to sustained enhancements in performance (Lee & O'Neill, 2003).

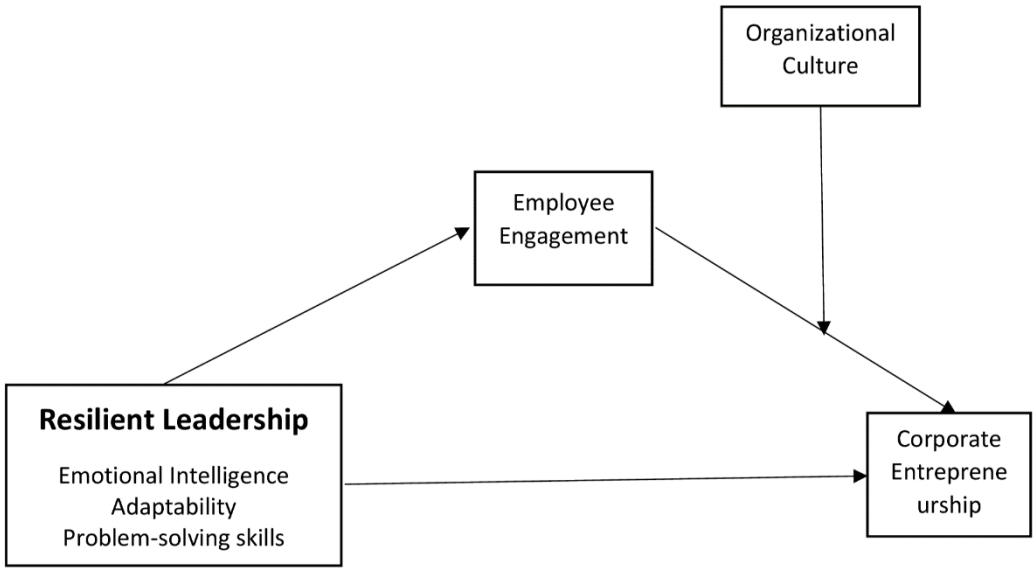

Figure: 1 Theoretical Framework

LITERATURE REVIEW

Resilient leadership and Corporate Entrepreneurship:

Effective management of stress and setbacks by leaders can propel their organizations towards improved performance and greater innovation (Kossek and Perrigino, 2016). Leaders assist their employees in reinterpreting previous challenges and approaching old issues with fresh, innovative solutions (Eisenbeiss et al. 2008). This fosters a collaborative relationship among employees, enabling them to identify innovative solutions (Soyal 2020). Resilience is understood as a personal resource that aids individuals in adjusting to challenging situations (Caniëls, M.C.J, 2018). Leaders could develop strategies and frameworks within businesses, and they can inspire and motivate others through their creativity and support (Yukl, 2020). While leaders can encourage and motivate employees, it's vital to provide workers with the autonomy and independence they need in their roles. By assigning tasks effectively, employees are encouraged to act independently, which in turn allows leaders to build trust in their subordinates' abilities and earn their respect. This dynamic is characterized by mutual trust and the recognition of subordinates' thoughts and feelings.

The major capabilities such as innovativeness and adaptation that are linked with corporate entrepreneurship are vital for attaining outstanding performance in unstable environments (Martín Rojas et al., 2017). Leadership is not merely a role or title; rather, it is a complex ethical relationship among individuals grounded in a shared vision, commitment, and trust (Yukl, 2020). Corporate entrepreneurship is one strategy which can be used by management to encourage the employees for more innovative initiatives which is beneficial for the organization (Åmo, 2010). Bernard and Barbosa (2016), and Agostini & Nosella (2022), admired that risk tolerant organizations absorb errors easily and can promote new methods of work Shakil, M. H., Zuhudi, N. W. B. M., & Idrees, R. N. (2024).

Adaptability and Employee Engagement:

When adaptive leaders give employees ongoing opportunities to improve and make their skills flourish along with emphasize upon learning new approaches.. Adaptive change to the changing conditions of the environment is the central theme in the studies on organizations (Uhl-Bien and Arena 2018) and is considered vital for organizations in all sectors. An adaptive stance encompasses an intellectual approach that establishes the necessary conditions for adaptability, as well as a specific method of decision-making in intricate scenarios (Grisogono & Radenovic 2011). Adaptive performance broadens the concept of adaptability from an individual's potential to act in a particular manner to showcasing this through their actions. Shoss et al. (2012) highlight that adaptive performance includes various behaviors rather than just the capability or willingness to adapt. Leadership qualities like adaptability, a focus on results, versatility, and analytical reasoning typically impact the success of a project (Müller and Turner, 2010). Therefore, this study can propose the following hypotheses.

HO1: *There is a significant relationship between Adaptability and Employee Engagement*

Given the swift pace of globalization and advancements in technology, it has become essential for organizations to prioritize the adaptation and engagement of employees to maintain a competitive edge (Hodliffe, 2014).

Emotional Intelligence and Employee Engagement:

A study conducted by Liu and Cho (2018) revealed that managers who possess a high degree of emotional intelligence are viewed as valuable assets to their organizations, and the emotional intelligence of leaders can have a significant influence employee engagement in their work. Leaders with high emotional intelligence demonstrate greater resilience when navigating organizational changes and build more collaborative relationships. Consequently, EI leaders tend to be more effective in addressing operational challenges and enhancing employee engagement compared to leaders who foster antagonistic relationships.

Salovey and Mayer contributed towards the introduction and conceptualization of Emotional Intelligence by highlighting it as an ability-based framework similar to generalized intelligence. Emotional intelligence (EI) has been characterized differently across various sectors and nations, and it is recognized as a crucial metric for effective leadership which eventually leads to employee engagement (Barreiro and Treglown, 2020; Chen et al., 2015). Furthermore, the research conducted by Barreiro and Treglown (2020) examines emotional intelligence (EI) at a detailed level to forecast employee engagement, showing that certain EI traits have a considerable effect on engagement levels. Leaders with emotional intelligence cultivate supportive and motivating relationships with their employees, leading to improved employee performance (Polychroniou, 2009). Hence, this study can postulate the hypotheses.

HO2: *There is a significant relationship between Emotional Intelligence and Employee Engagement.*

Many research studies indicate that emotional intelligence can positively influence employee attitudes and behaviors in roles that require emotional demands by increasing the level of job-satisfaction and decreasing stress related to job (Sanchez-Gomez, M.; Breso, E, 2020).

Resilient leadership and Employee Engagement:

A study conducted by Galanti and colleagues (2021) examined how leadership communication and resilience during crises affects employee engagement. The results showed that employees who felt their leaders communicated effectively experienced higher engagement levels and reduced stress. To support employees amid disruptions, organizations can offer access to various resources, including extended child or elder care, transportation for late hours and importantly, recognition of employee efforts (Ernst and Young Global, 2020). Competent leaders are recognized for their ability to strategically instill resilience in employees, enhancing their engagement by transforming

the stress and challenges resulting from situations like Covid-19 into renewed energy (Lombardi et al., 2021). The existing research on resilience highlights its critical significance, as its fundamental idea is to maintain an organization's unity and coherence in the face of disruptions and challenges resulting from adversity (Gölgeci et al, 2020). Aspects such as efficacy, empowerment, a clear vision and the ability to support and respond are proposed to enhance leaders' resilience.

The existence of resilience in a leader does not automatically ensure its transfer to followers. As depicted by Giustiniano et al. (2018), resilience must be demonstrated and communicated to others by individuals themselves in order for it to be amplified from individuals to teams. Furthermore, it must be recognized by the recipients. Studies indicate that resilient leaders can effectively disseminate resilience and they tend to adapt and grow in response to challenges. (Giustiniano et al., 2020).

Resilient leaders are thus crucial for fostering resilience as they facilitate a process which involves learning to unlearn and learn (Giustiniano et al., 2020), striving to balance reaction and the factor of adaption while ensuring the transformation of stressors and shocks into absolute renewed energy. Empowering employees allows them to contribute to solutions and increase employee engagement, helping both leaders and employees become anti-fragile by leveraging crises and challenges as opportunities (Koss, 2020). Likewise, foresight or vision represents an essential anticipatory aspect of resilience, reliant on predicting future events (Renjen, 2020). By empowering employees to participate in finding solutions, leaders are better positioned to recover and become anti-fragile, turning adversity and different form of crises into opportunities (Koss, 2020).

Employee Engagement and Corporate Entrepreneurship:

Research has indicated that the concept of Corporate Entrepreneurship offers resources and a platform for employees to engage in innovative thinking and implement creativity, leading to improved individual and organizational results (Morris et al., 2009). To support this, various models have been presented in which key scholars have identified five internal organizational aspects that can promote an entrepreneurial atmosphere and can thus be classified as dimensions of Corporate Entrepreneurship (Kuratko et al., 2005; Wood et al., 2008).

When employees recognize the components of CE, they are likely to experience engagement (Umair et al. 2020). According to Hewitt (2015), engaged employees contribute to competitiveness and the achievement of performance goals. Saks (2006) indicates that when employees become engaged in their work, they feel a sense of control, which leads to support and acknowledgment from their organization. CEOs favor employees who demonstrate enthusiasm, as they are more inclined to commit to their responsibilities and enhance the organization through strong job and organizational performance (Rich et al., 2010). Engaged employees immerse themselves in their tasks, embrace new experiences, and are eager to learn new skills to creatively enhance their performance (Bakker and Xanthopoulou, 2013). Kassa and Raju (2015) identified a connection

between Employee Engagement and Corporate Entrepreneurship. Hence, this study can postulate the following hypotheses:

HO3: *There is a significant relationship between Employee engagement and Corporate Entrepreneurship.*

Employees who are engaged often display greater determination and dedication in difficult situations, enhancing the organization's capacity to recover from setbacks. (Murad, M., & Rambely, N. A. S, 2024) This supports the idea that engaged employees serve as an important asset for organizations dealing with challenges (Dirani, et al., 2020).

Moderating Role of Organizational Culture:

Organizational culture refers to the value system present in the workplace, which affects how employees think and act, leading to notable differences within and among organizations (Warrick et al., 2016). According to Schneider et al., (2013), the organizational culture is the norms as perceived by the employees in their workplace and these norms shape their behavior in adapting to meet the objective of the organization. As indicated by Raza et al, (2014), a strong organizational culture is an essential factor which aligns the future course of business for the organization. In the context of a strong organizational culture, organizational members share one common and integrated opinion about the organization and agree with the organizational values (Flamholtz & Randle., 2011).

Organizational culture works like a glue as it plays a role in bonding employees and the system of an organization together. Furthermore, at the same time it produces a work behavior which is positive as well as innovative (Khan et al., 2018). Flexible organizational culture maintains innovation (Ghosh, 2015). Organizational culture is viewed as a vital organizational asset and a key competency that fosters alignment between the values of the organization and those of its employees, which is related to “organizational performance” (Boon-Seng Tan, 2019).

Problem Solving Skills and Employee Engagement:

Some studies indicate that it is feasible to enhance employee proactivity and engage them through training and development initiatives, including problem-focused interventions that alter certain aspects of the existing work environment (e.g. Strauss and Parker, 2018). Furthermore, problem-solving is a vital skill for most leaders, and its significance has grown due to the fast-paced evolution of technology and increasing societal turmoil. Individuals who possess a leadership mindset are often regarded as effective problem solvers, as they tend to generate numerous creative and innovative solutions to challenges. A person's leadership qualities can be identified through their confidence, communication style, language proficiency, and actions. Those with a leadership spirit are generally inclined to articulate their thoughts and ideas (Anwar et al., 2020) Problem-solving proves beneficial in various scenarios, including disruptions at work (such as accidents, equipment breakdowns, supply shortages, and adverse weather conditions), disputes over work roles, and challenges faced during the execution of a new project or significant change.

Conversely, the required levels of clarification, planning, and oversight heavily rely on the specific nature of the task, as well as the abilities and dedication of team members. Hence, this study can postulate the following hypotheses.

HO4: *There is a significant relationship between Problem Solving Skills and Employee Engagement.*

RESEARCH METHODOLOGY

There are four principal research paradigms commonly utilized: pragmatism, interpretivism, positivism, and post-positivism. To ensure objectivity in the research, as advised by specialists, this study employs a positivist research paradigm. Positivism's ontological and epistemological perspectives assert that a singular reality exists and that there is a defined relationship between the researcher and the research. This study maintains a degree of separation and impartiality. By adopting a positivistic approach, this research investigates the connections between variables. Within positivism, the researcher maintains an objective stance and adheres to a formal writing style based on established principles (Park et al, 2020). In this study, quantitative methodology is considered as the most appropriate method due to the objective and practical nature of the study. Furthermore, to achieve the objectives of the study, deductive approach has been used. If an information research study prioritizes observable facts, then adopting a positivist paradigm is appropriate (Brink, Van der Walt and Van Rensburg, 2012) since positivists believe that knowledge is grounded in sensory experience. Consequently, the present research is clear and aligns with positivism as the suitable approach for data collection and sampling.

Sampling:

In the context of a positivist approach, probability sampling is a commonly employed technique. Stratified sampling is particularly prevalent in actual sampling surveys. When using the same sample size, it offers greater accuracy, easier management, lower costs, and higher effectiveness compared to simple random sampling. This article utilizes stratified sampling. Furthermore, the respondents in this study had a minimum experience of five years. Rao-soft software was used to determine a sample size of 377 respondents which indicates that the number of respondents is sufficient, as demonstrated in Equations (1)– (3):

$$x = Z(c/100)2r\ (100 - r) \quad (1)$$

$$n = N\ x/\ ((N - 1)E2 + x) \quad (2)$$

$$E = Sqrt\ [(N - n)\ x/n\ (N - 1)] \quad (3)$$

Twenty percent of the questionnaires were sent to upper management while the remaining eight percent questionnaires were provided to the middle management. The questionnaires were accurately completed and returned by a total of three hundred respondents. Respondents took fifteen days to fill it out. Their familiarity with the instrument’s principles was confirmed; they

either had direct experience with similar systems or possessed the cognitive skills needed to comprehend and apply the instrument.

Instrumentation:

A key element of this study is the instrument utilized for data collection. Various approaches exist for gathering data. Some methods are designed for collecting primary data, including interviews, observations, questionnaires, and focus group discussions, while others focus on secondary data from sources such as websites and annual reports. A close-ended questionnaire was used to collect information in this study. The design of the close-ended questionnaire considered the research framework to ensure that participants provided unbiased answers. A five-point Likert scale was used with a range from strongly disagree to strongly agree. The numerical values ranged from one to five where one signifies the lowest while five denotes the highest level of agreement.

Data Analysis:

For evaluation of measurement models and the structural equation modeling (SEM), this research utilized Smart PLS-3 software. To assess the measurement model and structural equation model by means of SEM, the methods utilized include Algorithms and Bootstrapping. The choice of Smart PLS-3 software was based on its multiple advantages such as its effectiveness in handling complex models, its superior performance with small data sets, and its lack of normality requirements. Additionally, Smart-PLS is user-friendly and convenient, making it a preferred choice among many researchers compared to other software options.

RESULT AND ANALYSIS

Reliability values are presented in Table 1. Cronbach's Alpha, composite reliability and average variance extracted were the methods utilized to establish the credibility of this research. According to Tavakol and Dennick, Cronbach's Alpha typically has a range of 0.70 to 0.95, although various reports exist regarding its acceptable threshold. A Cronbach's Alpha reliability value ranging from 0.895 to 0.783 which are deemed acceptable are reported by this study.

Table 1. Reliability

Variables	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)
Adaptability	0.895	0.927	0.703
Corporate Entrepreneurship	0.811	0.834	0.643
Emotional Intelligence	0.869	0.908	0.670
Employee Engagement	0.875	0.897	0.729
Organizational Culture	0.783	0.802	0.601
Problem Solving Skills	0.883	0.912	0.734

Additionally, a composite reliability value of 0.70 or higher is considered acceptable, while an average variance extracted value of 0.50 or greater is also deemed acceptable (Alarcón, D.; Sánchez, 2015). 0.802 is the lowest value of composite reliability in this study, which exceeds the minimum acceptable threshold, and the lowest value for average variance extracted is 0.601, also surpassing the acceptable limit. Therefore, the amount of variance which is captured by the construct (AVE) is deemed acceptable, and the CR, providing a less biased measure of reliability is satisfactory in this study.

Discriminant Reliability:

To evaluate discriminant reliability, the Fornell-Larcker criterion and an examination of cross-loadings were primarily utilized (Henseler, J.; Ringle, C.M). However, the Fornell-Larcker approach failed to accurately assess discriminant validity. As a result, this study employed alternative techniques, including the multitrait-multimethod matrix to gauge discriminant validity. Additionally, the heterotrait-monotrait correlation ratio was applied. Henseler and Ringle suggested that for discriminant validity to be confirmed, the heterotrait-monotrait ratio should be below 0.85. There are no concerns regarding discriminant validity, all the values presented in Table 2 are under 0.85.

Table 2. Discriminant reliability.

	Adaptability	Corporate Entrepreneurship	Emotional Intelligence	Employee Engagement	Organizational Culture	Problem Solving Skills
Corporate Entrepreneurship	0.745					
Emotional Intelligence	0.330	0.465				
Employee Engagement	0.417	0.652	0.540			
Organizational Culture	0.677	0.744	0.210	0.505		
Problem Solving Skills	0.080	0.182	0.084	0.095	0.100	
Organizational Culture	0.308	0.483	0.277	0.276	0.436	0.075

Table 3 presents the factor loadings used to evaluate the research model. The items in the outer loadings must be (≤0.50). Most items exceeded the accepted value, but a few did fall below the minimum threshold of 0.50. The factor loading indicates that within the adaptability variable, item A5 had the highest loading at 0.910, while A4 had the lowest at 0.726. In the perceived corporate entrepreneurship variable, CE1 recorded the highest value at 0.884, whereas CE4 had the lowest factor loading at 0.647. Furthermore, the emotional intelligence variable showed values ranging from 0.930 for EI2 to 0.644 for EI3. Additionally, the employee engagement variable displayed loading values from 0.914 for EE4 to 0.756 for EE5. The organizational culture variable, represented by OC5 and OC4, had loading values of 0.795 and 0.727, respectively. Finally, the

problem-solving skills variable ranged from 0.895 for PS4 to 0.782 for PS5. This indicates that unrelated constructs have been removed to enhance the reliability of the data. Therefore, stakeholders can trust the findings of the study when making their decisions.

Table 3. Confirmatory factor analysis.

	Adaptability	Corporate Entrepreneurship	Emotional Intelligence	Employee Engagement	Organizational Culture	Problem Solving Skills
A1	0.785					
A2	0.932					
A3	0.821					
A4	0.726					
A5	0.910					
CE1		0.884				
CE2		0.833				
CE4		0.647				
CE5		0.825				
EE1				0.849		
EE2				0.888		
EE4				0.914		
EE5				0.756		
EI1			0.900			
EI2			0.930			
EI3			0.644			
EI4			0.914			
EI5			0.650			
OC1					0.784	
OC2					0.792	
OC4					0.727	
OC5					0.795	
PS1						0.852
PS2						0.892
PS4						0.895
PS5						0.782

A specific diagram-based approach was employed to investigate the connections between multivariate variables following Wright (1921), which led to the derivation of the term ‘path coefficients. Hypothesis HI, which represents the connection between adaptability and employee engagement, is supported. The results indicate that H1 is confirmed, showing that perceived adaptability positively impacts employee engagement. The p-value is lower than 0.05. Hypothesis H4 is not supported, meaning there is no connection between problem-solving skills and employee engagement. Since the P and T values exceed the accepted thresholds, they suggest that problem-solving skills do not have a positive effect on employee engagement (p = 0.162, t = 1.397).

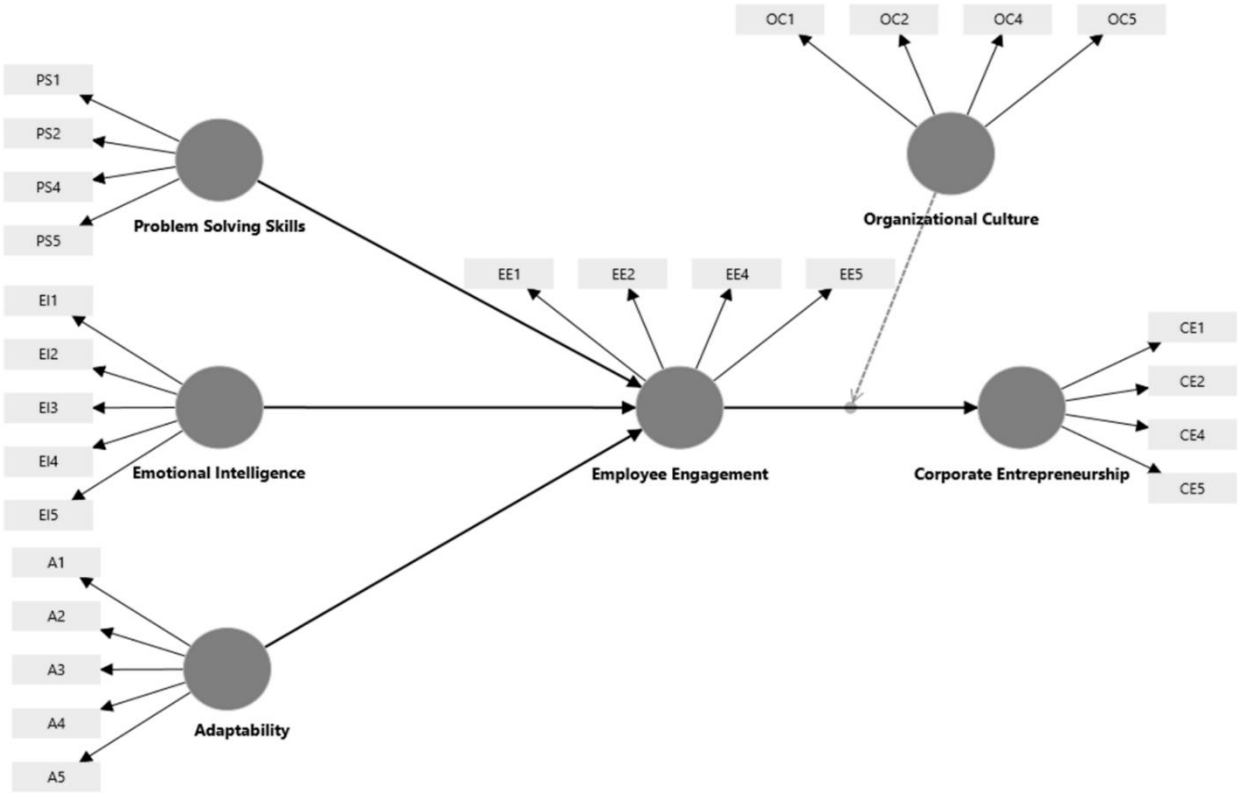

Figure2: Confirmatory factor analysis

Table 4. Path coefficient

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
Adaptability -> Employee Engagement	0.284	0.286	0.061	4.648	0.000
Emotional Intelligence -> Employee Engagement	0.394	0.395	0.071	5.575	0.000
Employee Engagement -> Corporate Entrepreneurship	0.349	0.352	0.056	6.227	0.000
Problem Solving Skills -> Employee Engagement	0.108	0.112	0.077	1.397	0.162

The study supports hypotheses H1, H2 and H3 revealing that both adaptability and emotional intelligence significantly enhance employee engagement and corporate entrepreneurship. The p-values, along with the f and t values, fall within an acceptable range. The subsequent table serves as a valuable resource for practitioners when deciding how to utilize the research model. It outlines model testing and the implications of the outcomes. The acceptance and rejection of the hypotheses provide important guidance for practitioners aiming to establish a clear strategy for incorporating BSC concepts within their organizations.

Discussion:

This study examines the relationship between resilient leadership and corporate entrepreneurship with employee engagement acting as a mediator. The components associated with resilient leadership include adaptability, emotional intelligence and problem-solving skills. Their relationships with employee engagement are analyzed separately depicting the role they play in engaging the employees and eventually leading to enhancement in corporate entrepreneurship. Organizational culture serves as a moderating variable as it moderates the relationship between employee engagement and corporate entrepreneurship

Consequently, this study is significant in bridging that gap and offering an in-depth perspective on how resilient leadership influences corporate entrepreneurship. Our results indicates that adaptability of leaders has a significant impact on employee engagement, hence supporting the hypotheses H1. When adaptive and resilient leaders provide employees with ongoing chances to enhance their skills and learn new methods, workers feel more empowered to take calculated risks and explore innovative ideas (Tiwari & Lenka, 2016), thus becoming more flexible and engaged. An adaptive stance encompasses an intellectual approach that establishes the necessary conditions for adaptability, as well as a specific method of decision-making in intricate scenarios (Grisogono & Radenovic 2011). Furthermore, emotional intelligence of the leaders also has a significant

impact on employee engagement, hence supporting the hypotheses H2. Leaders with emotional intelligence cultivate supportive and motivating relationships with their employees, leading to improved employee performance (Polychroniou, 2009). When employees recognize the components of CE, they are likely to experience engagement (Umair et al. 2020). Kassa and Raju (2015) identified a connection between employee engagement and corporate entrepreneurship, hence supporting hypotheses H3. However, H4 is not accepted as depicted by the p value clearly illustrating the absence of a significant relationship between problem-solving skills and employee engagement. Some prominent capabilities that are linked to corporate entrepreneurship include being innovative and proactive along with resilience, are essential for achieving exceptional performance in volatile environments (Ayala and Manzano, 2014)

CONCLUSION AND POLICY IMPLEMENTATION

This section elaborates on the study's implications and is followed by the overall conclusion of the study.

Theoretical implications

This study contributes significantly towards understanding the relationship between resilient leadership and corporate entrepreneurship. The existing research on resilience underscores its enduring significance, as its fundamental idea is to maintain an organization's unity and integrity amidst the challenges and disruptions brought on by adversity (Gölgeci et al., 2020). Research indicates that individuals with high resilience tend to handle challenges and changes more effectively (Rossi, Meurs, & Perrewé, 2013). However, studies surrounding this topic are still emerging, with a majority concentrating on how various leadership styles relate to employee resilience (Sommer et al., 2016) instead of exploring the impact that resilient leadership has on corporate entrepreneurship. Our findings cover this gap by illustrating that resilient leadership has a significant and positive impact on employee engagement, consequently resulting in enhanced entrepreneurial activities in organizations. During crises and eve under normal circumstances, the leader acts as the representative for various stakeholders and is essential in guiding the organization's path. Specifically, amidst significant uncertainty, middle managers closely observe their leaders to understand how their organizations will react to and recover from this unexpected situation, enabling them to take appropriate action. This study also supports the principal-agent theory, according to which resilient leadership significantly influences the innovation efforts and overall performance of an enterprise (Lee & O'Neill, 2003). The mediating role of employee engagement contributes to the study as there is evidence demonstrating the significant impact engaged employees have on corporate entrepreneurship. Organizational culture works like a glue as it plays a role in bonding employees and the system of an organization together. Furthermore, at the same time it produces work behavior which is positive as well as innovative (Khan et al., 2018).

Practical implications

The question of fostering corporate entrepreneurship through resilient leadership is a significant one, as researchers and business professionals seek novel approaches to enhance innovativeness, proactiveness, and risk-taking. It's important to recognize that resilient leadership and corporate entrepreneurship are examined at different analytical levels. Resilient leadership is generally considered at the individual level, while corporate entrepreneurship is viewed from an organizational perspective. Consequently, promoting an entrepreneurial orientation by nurturing resilient leadership should be focused upon by hiring and developing resilient leaders. The implications of this research are applicable to leaders at various levels including managers and organizational leaders where innovation has a significant role. Organizations should focus on developing leaders that specifically possess the characteristics of high emotional intelligence and adaptability. This would eventually lead to engagement and empowerment of employees leading to success of organizations through innovation. The results also demonstrate that organizations should place a considerable amount of emphasis upon leadership development initiatives that contribute towards the development of resilient leaders. Moreover, a culture that supports innovation and collaboration among employees should be focused upon. Current and future leaders can benefit from programs primarily formulated to enhance adaptability and emotional intelligence among leaders

Limitation and Directions for Future Research:

This study has a few limitations, one being the absence of longitudinal studies. Consequently, this study may provide a foundation for future for conducting longitudinal studies for further research to investigate the effect that resilient leadership has on corporate entrepreneurship overtime. Secondly, the other limitation consists of the selection of a precise sample size due to shortage of time. Furthermore, this research primarily examined the variables of adaptability, emotional intelligence and problem-solving skills in resilient leaders, however, future research could investigate other variables that may have a significant impact on employee engagement and corporate entrepreneurship.

Conclusion

The basic aim of this research was to study the impact of resilient leadership on corporate entrepreneurship, with employee engagement serving as a mediator and organizational culture serving as a moderator in their connection. The findings clearly depict that the presence of characteristics like adaptability and emotional intelligence contribute towards engaging employees ultimately empowering them to play a significant role in entrepreneurial activities. Furthermore, the strong evidence from our research indicates that resilient leaders have the ability to think strategically about the long-term, genuinely prioritize the well-being of their people and stakeholders, ethically and creatively oversee the business, and effectively balance social and environmental responsibilities with economic advantages to attain success in corporate entrepreneurship. The difficulties that arise in unpredictable situations cannot be effectively

addressed by relying on traditional forms of leadership which include charismatic, transformational or transactional leadership; therefore, it is essential for leaders to harness the trait of resilience during such challenging periods.
